What's New

We've updated the application to run on the latest version of .NET, bringing better performance and reliability improvements across the board.

Performance & Stability

Faster, more responsive interface

- Replaced system monitoring with lighter processes — the program now uses less memory and responds faster when you're working
- Fixed issues that caused the interface to freeze when loading large playlists or managing video files quickly
- Improved how the program handles multiple screens — it should feel snappier when controlling multiple video windows at once

More reliable REST API

- Completely replaced the internal web server that handles API requests — this fixes crashes that used to freeze the program and allows us to handle significantly more simultaneous requests

---

Database & File Management

Better file handling

- Improved how the program reads and stores data — upgraded our database system for better security and performance
- Fixed issues when upgrading from older versions
- Better handling of file paths with spaces and special characters

---

Playback & Recording

Smoother playback experience

- Fixed freezing when quickly double-clicking files
- Fixed video playback loops stopping too early when you changed playback speed
- Fixed YouTube playback issues
- Preview window now closes properly when you exit the program
- Better handling of transitions between playlist items

More reliable video controls

- Switching video inputs no longer resets your settings
- Crop settings now apply correctly when you start the program
- Fixed crashes when switching between network sources and quick buttons rapidly
- Better detection when a screen is disconnected or unavailable

---

Templates & Graphics

Easier template management

- New wizard makes it simpler to import templates from older databases, see guide.
- Fixed errors when opening the template editor for the first time
- Better handling of spacing in file paths in user name and API.

Integration & Controls

Improved external control

- New options for sports data (swimming heat information)
- Network controls more reliable — fixed issues where some commands weren't being saved
- StreamDeck and Companion plugins now have more actions and better organization

---

Technical Improvements (For Operators)

- More detailed logging for troubleshooting, see guide.
- Auto-start feature enabled by default for the background service
- Fixed permission prompts that appeared unnecessarily on some systems
- Progress notifications now update more smoothly
